(54) ELECTRONIC CAMERA PICKING UP IMAGE THROUGH GLASS

(57)Abstract:

PROBLEM TO BE SOLVED: To facilitate adjustment of an image-pickup direction and to prevent an image reflected in the inside of a window from being image picked up in the case of picking up image through the outside of the window by fixing the electronic camera in a direction desired of image pickup in the case of conducting image pickup for many objects such as an aircraft, a train, an automobile or a building or the like through the window glass thereof over a long time.

SOLUTION: A stationary section 1 is provided in front of an electronic camera to fix the electronic camera onto a window glass. Since a sucker or an adhesive member is used for the stationary section 1, the stationary section 1 can be mounted easily, removed easily and fixed strongly, without falling off due to vibration. Since a hood section 3 prevents light from a back side, this side of the window is not photographed, even if this side is bright. A ground object is photographed through a window of an aircraft, and an object in the horizontal direction is photographed through a front glass of an automobile by setting an angle between the stationary section 1 and the photographing direction of the electronic camera to be around 45 degrees. Since the electronic camera is supported freely turnably by a support section 4, the photographing direction is properly adjusted.
